FEATURE

Wireless connection between operation unit, touch panel, and titration unit/
Simultaneous measurement with up to 4 titration units

AT-710M

By the use of wireless adapters (Bluetooth®, Commercialized product), the operation unit and the titration unit can be used together without being connected to each other with a cable. You can carry out titration of a sample, which emits poisonous gas, safely by keeping the titration unit inside a draft chamber while keeping the operation unit outside of it. You may place the operation unit on the opposite side of aisle or hold it with your hand by connecting a battery (Commercialized product) to it for operation. Attaching a monitor arm to the main control unit allows for flexibility of its mounting position. (The arm mount of the display is compliant with VESA standard 75mm x 75mm.)

Reagent information stored in burette unit

AT-710M

AT-710S

Information of titrant is stored in the IC chip on the burette unit. The info is firm even when the burette unit is transferred from one titration unit to another and thus there is no need to re-enter the information into the titration unit. This function prevents you from using wrong reagent.

New-type burette unit

AT-710M

AT-710S

AT-710B

The burette unit has the switching valve on top of the cylinder. The structure reduces dead space in the tube between the cylinder and the switching valve. In addition to the reduction of dead space in the cylinder, the structure reduces amount of residual titrant to ease replacement of titrant.

Option : Reagent Bottle

Electrode information stored in electrode

AT-710M

AT-710S

AT-710B

By the use of the optional smart electrode cable, electrode information is stored in the cable, not in the titration unit. Exchange and use of multiple electrodes does not require recalibration of the electrodes.
